Autism spectrum disorder (ASD) is a biologically based neurodevelopmental disorder characterized by impairments in two major domains: While there is no “cure” for autism, there are several effective interventions that can improve a child’s functioning. Research also shows that intervention programs, including physical therapy, can help children with ASD. These programs help children with ASD learn skills. This document addresses activity therapy (for example, music, dance, art or play therapies) when used to treat autism spectrum disorders (ASDs) and Rett. The established therapies for ASD are nonpharmacologic and may include individual intensive interventions. OT is often used as a treatment for the sensory integration issues associated with ASD. It is also used to help. Aripiprazole (abilify) and risperidone (risperdal) are the only medications approved by the U.S. Food and drug administration for the treatment. Treatment of autism spectrum disorders - behavioral therapy - speech and language therapy - sometimes physical and occupational therapy - drug therapy. There are many things you can do to help a child with autism spectrum disorder (ASD) overcome their challenges. There are many types of treatments available. These include applied behavior analysis, social skills training, occupational therapy, physical.
